Helpful Tips for Today’s Session

• **To Ask a Question** — Type your question in the Q&A panel on the right side of your screen. If the panel is hidden, click on the control panel at the top to open Q&A.

• **To Answer a Poll Question** — Choices will be in the poll panel on the right side of the screen. If the panel is hidden, click on the control panel at the top to open the poll.

Lead and Copper Rule 101

*Requirements Before an Action Level Exceedance*
Lead and Copper Rule 101

Requirements Before an Action Level Exceedance

First in Three-Part Webinar Series

PART 1: Requirements Before an Action Level Exceedance
May 11th, 1 pm-2:30pm EDT and May 18th, 2:30-4pm EDT

PART 2: Requirements After an Action Level Exceedance
June 15th and June 29th, 1pm-2:30pm EDT

PART 3: Compliance Determination and Reporting Requirements
August 17th, 2:30pm-4pm EDT
The examples included in this presentation are intended for discussion purposes only. Throughout this presentation, the terms “state” or “states” are used to refer to all types of primacy agencies including U.S. territories, Indian tribes, and EPA Regions. The statutory provisions and EPA regulations described in this document contain legally binding requirements. This presentation is not a regulation itself, nor does it change or substitute for those provisions and regulations. Thus, it does not impose legally binding requirements on EPA, states, or public water systems. This guidance does not confer legal rights or impose legal obligations upon any member of the public. While EPA has made every effort to ensure the accuracy of the discussion in this presentation, the obligations of the regulated community are determined by statutes, regulations, or other legally binding requirements. In the event of a conflict between the discussion in this presentation and any statute or regulation, this presentation would not be controlling.

May 2016
Poll Question 1

How many people are in the room?

a) 1
b) 2
c) 3
d) 4
e) Greater than 5
Today’s Presenters

Victoria Banks, USEPA
Physical Scientist in the Drinking Water Protection Division within the Office of Ground Water and Drinking Water.

Eddy Viveiros, USEPA
Environmental Engineer in the Drinking Water Protection Division within the Office of Ground Water and Drinking Water.
How the Presentation is Organized

- Lead and Copper Rule and Revisions
- Health Effects and Sources
- Overview of the Lead and Copper Rule
- Lead and Copper Tap Monitoring Requirement
- 90th Percentile Calculation
- Requirements to Inform the Public
- Water Quality Parameter Monitoring
- Requirements related to Long-Term Treatment Changes and New Source Additions
Terminology for Primacy Agency

• State means Primacy Agency

• 40 CFR § 141.2 definition for State

• Possible Primacy Agencies
  – State
  – Tribal government
  – EPA region
Acronyms

AL: Action Level
ALE: Action Level Exceedance
CCT: Corrosion Control Treatment
CWS: Community Water System
LCR: Lead and Copper Rule
LCR MR: Lead and Copper Minor Revisions
LCR STR: Lead and Copper Short-Term Revisions and Clarifications
LSLR: Lead Service Line Replacement
MCL: Maximum Contaminant Level
MCLG: Maximum Contaminant Level Goal
M/R: Monitoring and Reporting (Violation)
NTNCWS: Non-transient Non-community Water System
OWQP: Optimal Water Quality Parameters
PWS: Public Water System
SOWT: Source Water Treatment
WQP: Water Quality Parameter
Regulatory Authority for Controlling Lead Levels in Drinking Water

• **The Lead Ban (1986):** A requirement that only lead-free materials be used in new plumbing and in plumbing repairs.

• **The Lead Contamination Control Act (LCCA) (1988):** The LCCA further amended the SDWA. The LCCA is aimed at the identification and reduction of lead in drinking water at schools and child care facilities. *However,* implementation and enforcement of the LCCA has been at each state’s discretion. School monitoring and compliance has varied widely.
  – There is **NO federal law requiring schools or child care centers to test drinking water for lead**

• **The Lead and Copper Rule (1991):** A regulation by EPA to minimize the corrosivity and amount of lead and copper in water supplied by public water systems.

• **The Reduction of Lead in Drinking Water Act (2011):** Revising the definition of lead free by lowering the maximum lead content of the wetted surfaces of plumbing products from 8% to a weighted average of 0.25%
Lead and Copper Rule (LCR)

  - Addresses corrosion of lead and copper in drinking water
    - primarily from service lines and household plumbing
  - Maximum Contaminant Level Goals (MCLG)
    - Lead – 0 µg/L
    - Copper – 1.3 mg/L
  - Requires a treatment technique (optimized corrosion control) rather than a Maximum Contaminant Level (MCL)
  - Tap sampling results (the 90th percentile) are compared to an action level
    - Lead - 15 µg/L
    - Copper - 1.3 mg/L
Lead and Copper Rule (LCR)

- Corrosion control is chemical treatment that is designed to reduce the corrosivity of water. The major optimal corrosion control treatment (OCCT) techniques are:
  - pH and/or Alkalinity Adjustment.
  - Inhibitor Addition (phosphate or silicate based inhibitors)

- For small/med systems, the action level for lead is a trigger for optimal corrosion control as part of the treatment technique. It is based on treatment feasibility; NOT on a health threshold.

- Large systems are required to optimize corrosion control regardless of their 90th percentile lead concentration, unless the difference between the 90th percentile and the highest source water lead concentration is <0.005 mg/L (PQL).
Lead and Copper Minor Revisions (2000)

Scope of Revisions

Reduced the burdens for systems, improved implementation, and provided some clarifications to 1991 rule.

The changes fell into seven broad categories

• Monitoring Requirements
• Public Education Requirements
• Special Primacy Considerations
• Demonstration of Optimal Corrosion Control
• Lead Service Line Replacement Requirements
• Analytical Methods
• Reporting and Record Keeping Requirements
Lead and Copper Short-Term Revisions (2007)

Scope of Revisions

Addresses implementation issues with existing rule:

- Monitoring revisions (sample number, timing clarifications).
- Additional requirements for providing public information.
- Advanced notification of treatment changes and source additions.
- Reevaluation of "tested-out" lead service lines.

Targeted changes based on input from National LCR Review.

Key elements of treatment technique requirements are unchanged.
Lead and Copper Long-Term Revisions

EPA is expecting to publish the proposed rule for review and public comment in 2017 and the final rule in 2019.

EPA’s primary goals in considering LCR Long-Term Revisions are to:

- Improve the effectiveness of the corrosion control treatment in reducing exposure to lead and copper, and
- Trigger additional actions that equitably reduce the public’s exposure to lead and copper when corrosion control treatment alone is not effective.

To learn more about the long term revisions and the stakeholders involved. Please see EPA’s Long-Term Revisions page:

https://www.epa.gov/dwstandardsregulations/lead-and-copper-rule-long-term-revisions
Health Effects of Lead in Children

Young children and infants tend to absorb more lead than the average adult.

The health effects of lead in children include:

- Impaired mental development
- IQ deficits
- Shorter attention spans
- Low birth weight

EPA set the MCLG at zero.
Health Effects of Copper

- Stomach and intestinal distress
- Complication of Wilson’s Disease
- Chronic Exposure can cause liver disease in genetically predisposed individuals

EPA set the MCLG at 1.3 mg/L
Lead and Copper Rule
Overview
Lead and Copper Rule
Overview

Three system size categories.

Large: > 50,000 people
Medium: 3,301 to 50,000 people
Small: 3,300 or fewer people

System size determines the sample number and applicability/timing of some requirements.
Lead and Copper Rule
Overview

CWS or NTNCWS Collects Lead and Copper Tap Samples

90th Percentile Is at or Below Both Action Levels*
- Conduct periodic lead and copper tap monitoring

90th Percentile Exceeds the Lead Action Level (15 μg/L)
- Begin LSLR replace 7% of LSLs per year

90th Percentile Exceeds the Copper Action Level (1.3 mg/L)
- Conduct public education due within 60 days
- Begin CCT steps includes WQP monitoring **
- Conduct source water monitoring (Install SOWT, if needed)
- Conduct periodic lead and copper tap monitoring

* Includes systems serving ≤ 50,000 people and (b)(3) systems
** Includes non-(b)(3) systems serving > 50,000 people, irrespective of their 90th percentile levels; (b)(2) systems must collect WQPs.
Review of Lead and Copper Tap Monitoring Requirements
Review of Monitoring Requirements
Site Selection - CWS

Three sampling site tiers: Tier 1, Tier 2 and Tier 3:

- Tier 1 sample sites are considered high risk sites.
- Tier 1 sampling pool consists of single* family structures that:
  - Contain copper pipes with lead solder installed after 1982 or contain lead pipes; and/or,
  - Are served by a lead service line. (collect 50% of samples from LSLs)

* May include multiple-family residences in sampling pool when they comprise at least 20 percent of structures served.
Review of Monitoring Requirements

Site Selection - CWS

• Tier 2 sampling pool consists of buildings including multiple family residences that:
  o Contain copper pipes with lead solder installed after 1982 or contain lead pipes; and/or,
  o Are served by a lead service line.

• Tier 3 sampling pool consists of single family structures that:
  o Contain copper pipes with lead solder installed before 1983.

Use representative sites throughout distribution system if insufficient number of tiered sampling sites are available.
Review of Monitoring Requirements
Site Selection - NTNCWS

Two sampling site tiers: Tier 1 and Tier 2.

- Tier 1 sampling pool consists of sample sites that:
  - Contain copper pipes with lead solder installed after 1982 or contain lead pipes; and/or,
  - Are served by lead service line.

- Tier 2 sampling pool consists of sample sites that:
  - Contain copper pipes with lead solder installed before 1983.

Use representative sites throughout distribution system if insufficient number of tiered sampling sites are available.
Review of Monitoring Requirements
Sample Collection Method

- First-draw
- 6-hour standing time
- One-liter volume

- System or residents can collect
- Samples are taken from kitchen/bathroom taps
Review of Monitoring Requirements
Sample Collection Method Continued

• Water Softeners:
  – Don’t collect samples from taps at homes with water softeners or other point-of-use or point-of-entry devices for inorganic removal.
  – If the only available sites have these devices, collect samples from the sites with the highest tier rating (Tier 1, followed by Tier 2 and then Tier 3).
Lead and Copper Tap Monitoring
Clarifications of Requirements for Collecting Samples and Calculating Compliance (2004 memo)

- EPA addressed 7 aspects of the requirements for collecting samples and calculating compliance:
  - All sample results from a system’s sampling pool during the monitoring period must be included in the 90th percentile calculation (even if this includes more samples than the required minimum number needed for compliance).
  - Customer-requested samples should not be used to calculate the 90th percentile, except in cases where the system is able to determine that the site selection criteria for compliance sampling are satisfied.
  - Only samples collected during the compliance monitoring period may be included in the 90th percentile calculation.
Lead and Copper Tap Monitoring
Clarifications of Requirements for Collecting Samples and Calculating Compliance Continued (2004 memo)

- States must calculate the 90th percentile even if the minimum number of samples are not collected.

- A proper sample is defined as a first draw one liter sample that is taken from an interior tap used for consumption (i.e. kitchen or bathroom sink) after the water has been standing in plumbing for at least six hours.

- To avoid sample collection problems, the system may wish to do the sampling itself or review the sample collection information before sending it to the lab.

- A State can invalidate a sample for one of the following reasons:
  - Improper sample analysis
  - Site selection criteria not met
  - Sample container was damaged in transit
  - Sample subjected to tampering
Lead and Copper Tap Monitoring
Management of Aerators during Sample Collection
(2006 memo)

- EPA recommends homeowners regularly clean their aerators to remove the particulate matter.
- EPA also recommends that sampling instructions NOT direct customers to remove or clean aerators prior to or during sample collection for lead and copper.
- If customers are only encouraged to remove and clean the aerators prior to sampling for lead, then the water system could fail to identify the typical contribution of lead from that tap.
- If a homeowner’s result (with aerator) is above the action level, the water system may want to take a second sample (without aerator or a clean aerator) to determine whether particulate matter is the source of lead.
- In the above example the results of both samples would be included in the set of samples used to determine the 90th percentile (i.e., the first sample could not be invalidated based on the presence of lead-bearing matter in the aerator).
Lead and Copper Tap Monitoring
Recommended Tap Sampling Procedures (2016 memo)

- Removal of Aerators: re-states recommendations from the 2006 memo.
- Pre-Stagnation Flushing: EPA recommends that sampling instructions not contain a pre-stagnation flushing step. Pre-stagnation flushing may potentially lower the lead levels as compared to when it is not practiced and may not be representative of normal water consumption.
- Bottle Configuration: EPA recommends that wide-mouth bottles be used to collect Lead and Copper compliance samples.
- The memo also includes an amended version of the homeowner tap sampling procedures originally provided in the 2010 Revised LCR Monitoring and Reporting Guidance for PWSs.
The State can invalidate a lead or copper tap water sample if any one of the following is true:

1. The laboratory establishes that improper analysis caused errors;
2. The State determines that the sample site did not meet the site selection criteria;
3. The sample container was damaged in transit; or
4. Substantial reason exists to believe that the sample was tampered with.
Lead and Copper Tap Monitoring
Sample Collection Continued

A sample cannot be invalidated due to:

- Alleged homeowner error in sample collection
- Excessive stagnation periods

After a sample is analyzed, a system cannot challenge the results.
Lead and Copper Tap Monitoring
Sample Collection Continued

• To request sample invalidation, system must provide:
  ✓ All sample results to the State
  ✓ Documentation for samples to be invalidated

• State’s decision to invalidate sample:
  ✓ Must be in writing
  ✓ Cannot be on the grounds that a follow-up sample result is higher or lower than that of the original sample

• Invalidated samples are not counted for compliance.
Lead and Copper Tap Monitoring
Sample Collection Continued

• Replacement samples must be taken:
  ✓ If needed to meet minimum sampling requirements

  ✓ As soon as possible but no later than 20 days after invalidation or by end of monitoring period (whichever is later)

  ✓ From the same locations as the invalidated samples, or if that is not possible, at locations other than those already used for sampling during the monitoring period

  ✓ The result must be included in the 90th percentile

• Replacement samples cannot be used to satisfy requirements for a subsequent monitoring period.
## Lead and Copper Tap Monitoring
### Minimum Number of Tap Samples

<table>
<thead>
<tr>
<th>System Population</th>
<th>Number of Sampling Sites (on Routine Monitoring)</th>
<th>Number of Sampling Sites (on Reduced Monitoring)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;100,000</td>
<td>100</td>

</tr>
<tr>
<td>≤100</td>
<td>5</td>
<td>5</td>
</tr>
</tbody>
</table>
Lead and Copper Tap Monitoring
Minimum Number of Samples Required

Systems with fewer than 5 taps for human consumption can do one of two things:

1. Collect multiple samples from same location on different days to meet 5 sample minimum.

Or

2. States may allow 1 sample per tap for human consumption if < 5 such taps.

*Note: If < 5 samples are taken, highest result is the 90th percentile level.*
Lead and Copper Tap Monitoring
Monitoring Period

Standard monitoring:
- Conducted at 6-month intervals from January-June or July-December
- Applies unless the system qualifies for reduced monitoring
- Not required during some corrosion control treatment steps

<table>
<thead>
<tr>
<th>System Population</th>
<th>Minimum Number of Sampling Sites</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;100,000</td>

<tr>
<td>101 to 500</td>
<td>10</td>
</tr>
<tr>
<td>≤100</td>
<td>5</td>
</tr>
</tbody>
</table>
Lead and Copper Tap Monitoring

Monitoring Period

Reduced Monitoring:

- Conducted at a reduced frequency and a reduced number of sample sites
- Conducted during a 4-month period from June-September, unless State approves an alternate period

<table>
<thead>
<tr>
<th>System Population</th>
<th>Minimum Number of Sampling Sites</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;100,000</td>
<td>50</td>

</tr>
</tbody>
</table>

*Same as standard monitoring.
Lead and Copper Tap Monitoring

Monitoring Period

Reduced Monitoring:

- Systems can go from standard monitoring to annual monitoring if:
  - System serving ≤ 50,000 people meets or is below both the lead and copper action levels (ALs) for 2 consecutive 6-month monitoring periods; or
  - Any system that meets optimal WQPs (OWQPs) and is at or below the lead AL for 2 consecutive 6-month monitoring periods.
- Annual monitoring begins in calendar year (CY) after criteria are met.

<table>
<thead>
<tr>
<th>6-Month Monitoring</th>
<th>Annual Monitoring Period:</th>
</tr>
</thead>
<tbody>
<tr>
<td>January – June</td>
<td>June 1 – Sept 30 of next CY</td>
</tr>
<tr>
<td>July - December</td>
<td></td>
</tr>
</tbody>
</table>
Lead and Copper Tap Monitoring

Monitoring period

• Systems can go from annual monitoring to triennial reduced monitoring if:
  – System serving ≤ 50,000 people meets or is below both the lead and copper action levels (ALs) for 3 consecutive years of annual monitoring*; or
  – Any system that meets OWQPs and is at or below the lead AL for 3 consecutive years of annual monitoring; or
  – Any system with 90th percentile levels ≤ 0.005 mg/L for lead and ≤ 0.65 mg/L for copper for 2 consecutive 6-month monitoring periods

• Begins in calendar year (CY) after meeting criteria

*The first 2 consecutive 6-month periods count as 1st year.
Lead and Copper Tap Monitoring
Three-Year Compliance Period

- Triennial monitoring must occur once during every 3-year compliance period
- Monitoring period is June – Sept. of same calendar year
- Cannot exceed 3 years between sampling events (see example)

<table>
<thead>
<tr>
<th>Year</th>
<th>Monitoring Period</th>
</tr>
</thead>
<tbody>
<tr>
<td>2009</td>
<td>June–September</td>
</tr>
<tr>
<td>2010</td>

</tr>
<tr>
<td>2011</td>
<td></td>
</tr>
<tr>
<td>2012</td>
<td>June–September</td>
</tr>
<tr>
<td>2013</td>
<td>(2nd compliance)</td>
</tr>
<tr>
<td>2014</td>
<td></td>
</tr>
</tbody>
</table>
Lead and Copper Tap Monitoring
Monitoring Waivers

• 9-Year Monitoring Criteria (Waiver)
  – System serves ≤ 3,300 people
  – System’s distribution system, service lines, and plumbing materials meet certain criteria that indicate negligible risk from lead and/or copper exposure (i.e., are lead- or copper-free)
  – 90th percentile levels are ≤0.005mg/L for lead and ≤0.65mg/L for copper
Lead and Copper Tap Monitoring
Nine-Year Compliance Period

- Nine-year monitoring must occur once every nine-year compliance period
- Monitoring period is June through September of same calendar year
- Cannot exceed nine years between sampling events (see example)

![Diagram showing June-September monitoring periods for two 9-year compliance periods: 2001-2009 and 2010-2018.]

1st 9-year compliance period: 2001-2009
2nd 9-year compliance period: 2010-2018
Lead and Copper Tap Monitoring
How a System Returns to Standard from Reduced Monitoring

• Return to Standard Monitoring if System serves:
  – ≤ 50,000 people and exceeds either AL during any monitoring period;
  – Any system which does not meet its state-specified OWQPs for more than 9-days in a 6-month period (i.e., excursion); or
  – Any system which meets its OWQP specifications but exceeds the lead AL

• Begins in January 1 of CY following monitoring period in which AL exceedance or excursion occurred
Review of 90th Percentile Calculations
90th Percentile Calculations

More than 5 Samples

• **Step 1:** Place lead or copper results in ascending order.

• **Step 2:** Assign each sample a number, 1 for lowest value.

• **Step 3:** Multiply the total number of samples by 0.9.
  
  Example: 20 samples x 0.9 = 18th sample.*

• **Step 4:** Compare 90th percentile level to AL (in above example, 18th sample).

* When more than minimum number of samples are collected, may need rounding or interpolation to determine 90th percentile sample.
90th Percentile Calculations
More than 5 Samples: Example Question

Assume 10 samples are collected with lead results as follows:

Site A: 0.005 mg/L
Site B: 0.015 mg/L
Site C: 0.005 mg/L
Site D: 0.014 mg/L
Site E: 0.014 mg/L
Site F: 0.005 mg/L
Site G: 0.040 mg/L
Site H: 0.014 mg/L
Site I: 0.014 mg/L
Site J: 0.005 mg/L

What is the 90th Percentile Value?
90th Percentile Calculations
More than 5 Samples: Example Answer

Step 1: Order results from lowest to highest:

1. Site A: 0.005
2. Site C: 0.005
3. Site F: 0.005
4. Site J: 0.005
5. Site D: 0.014
6. Site E: 0.014
7. Site H: 0.014
8. Site I: 0.014
9. Site B: 0.015
10. Site G: 0.040

Step 2: Multiply number of samples by 0.9 to determine which represents 90th percentile level

10 x 0.9 = 9th sample (or 0.015 mg/L)

Step 3: Compare to lead action level → No Exceedance
90th Percentile Calculations
Use of Rounding or Interpolation

- Use rounding or interpolation if:
  - You have collected more than 5 samples, and
  - The number of samples x 0.9 is not a whole number

**EXAMPLE:**
- System has 12 LCR compliance samples
- 12 x 0.9 = 10.8, which is not a whole number
- 10th highest sample lead result = 0.014 mg/L
- 11th highest sample lead result = 0.020 mg/L

**QUESTION:**
- What is the 90th percentile?
90th Percentile Calculations
Use of Rounding

**Step 1:** Round up to the nearest whole number

- E.g., 10.8\textsuperscript{th} sample ranking would round to the 11\textsuperscript{th} sample

**Step 2:** Use the sample result that corresponds to the rounded sample ranking from Step 1 as the 90\textsuperscript{th} percentile

- E.g., 11\textsuperscript{th} sample result = 0.020 mg/L

**Step 3:** Compare the sample result from Step 3 to the action level of 0.015 mg/L

- E.g., 0.020 mg/L is greater than 0.015 mg/L\rightarrow Action Level Exceedance
90th Percentile Calculations

Use of Interpolation

**Step 1:** Subtract the two sample results between which the 90\textsuperscript{th} percentile falls
- E.g., 90\textsuperscript{th} percentile = 10.8. Subtract 11\textsuperscript{th} and 10\textsuperscript{th} results.
  \[0.020 \text{ mg/L (11\textsuperscript{th} sample)} - 0.014 \text{ mg/L (10\textsuperscript{th} sample)} = 0.006 \text{ mg/L}\]

**Step 2:** Subtract the 90\textsuperscript{th} percentile and lower of the two numbers between which the 90\textsuperscript{th} percentile falls (falls between 11 and 10)
- E.g., 10.8 (90\textsuperscript{th} percentile) – 10 = 0.8

**Step 3:** Multiply the differences obtained in Steps 1 and 2
- E.g., 0.006 mg/L (from Step 1) x 0.8 (from Step 2) = 0.005 mg/L (rounded)

**Step 4:** Add Step 3 result to the lower of the two sample results
- E.g., 0.005 mg/L (from Step 3) + 0.014 mg/L (10\textsuperscript{th} sample result) = 0.019 mg/L
  \[\text{Action Level Exceedance}\]
90th Percentile Calculations

5 Samples

**Step 1:** Place results in ascending order

**Step 2:** Average 4th and 5th highest sample results

**Step 3:** Compare 90th percentile level to action level
90th Percentile Calculations
5 Samples: Example Question

Assume 5 samples are collected with lead results as follows:

Site A: 0.009 mg/L
Site B: 0.011 mg/L
Site C: 0.020 mg/L
Site D: 0.009 mg/L
Site E: 0.010 mg/L

What is the 90th Percentile Value?
90th Percentile Calculations
5 Samples: Example Answer

**Step 1:** Order results from lowest to highest:
1. Site A: 0.009 mg/L
2. Site D: 0.009 mg/L
3. Site E: 0.010 mg/L
4. Site B: 0.011 mg/L
5. Site C: 0.020 mg/L

**Step 2:** Average 4th & 5th samples highest samples to get 90th percentile value = 0.016 mg/L

$$\frac{0.011 \text{ mg/L} + 0.020 \text{ mg/L}}{2} = 0.0155 \text{ mg/L}$$

**Step 3:** Compare average to lead action level ➔ Exceedance
90th Percentile Calculations
Fewer than 5 Samples

- Procedure has changed under STR.
- Some systems may collect < five samples.
- Sample with highest result is 90th percentile level.

Assume 3 lead samples: 0.020 mg/L, 0.008 mg/L, and 0.005 mg/L.

90th percentile = 0.020 mg/L

- No M/R violation.
Requirements to Inform the Public
Lead and Copper Rule
Requirements to Inform the Public before an ALE

- Consumer Notification of Lead Tap Water Results.
- Consumer Confidence Report Lead Informational Statement.
Requirements to Inform the Public
Lead Consumer Notice

Systems Affected

• All CWSs and NTNCWSs

Rule Requirements

• Provide notice of lead tap water monitoring results
• Provide irrespective of whether sample exceeds lead AL
• Provide to all served by sampling site -- not just ones with water bills
• Provide as soon as practical but within 30 days after receives results
• Provide by mail or other State-approved methods
Requirements to Inform the Public
Lead Consumer Notice

Notice must include:

✓ Results of lead tap water monitoring
✓ Explanation of lead health effects
✓ Steps consumers can take to reduce exposure
✓ Facility contact information
✓ MCLG and AL for lead and their definitions*

* Must use CCR Rule language in § 141.13(c).
Requirements to Inform the Public
Lead Consumer Notice

Within 3 months after the monitoring period ends, the system sends the State:

• Sample of lead consumer notice, and

• Certification that notification meets delivery requirements.

• Sample certification available in revised M/R and State implementation guidances.*

* [http://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P100DP2P.txt](http://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P100DP2P.txt)
Requirements to Inform the Public
Consumer Confidence Report (CCR) Requirement

**Systems Affected**

- All CWSs

**Rule Revision**

- All CCRs must include:
  - Sources of lead in drinking water.
  - Health effects from lead exposure.
  - Ways to reduce lead in drinking water.
  - Recommended flushing times.
  - Places to go for more information including lead testing.

- Required regardless of lead sample levels.
Requirements to Inform the Public
Consumer Confidence Report Requirement (CCR)

Must include following mandatory language

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. [Name of Utility] is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

Or write own statement in consultation with State.
Water Quality Parameter Monitoring
Water Quality Parameter Monitoring

- Required for all large systems (systems serving more than 50,000 persons)

- Required for small/medium systems that exceed the lead or copper action level

- Sample site locations
  - Representative locations (e.g., coliforms and disinfectant residual sites)
  - Entry point to the distribution system
Water Quality Parameter Monitoring

Purpose of WQP monitoring:

- To assist in determining water corrosivity
- To identify appropriate corrosion control treatment
- To determine whether corrosion control treatment is being properly maintained
## WQP Monitoring - Parameters

<table>
<thead>
<tr>
<th>Typical Water Quality Parameters</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>pH&lt;sup&gt;1&lt;/sup&gt;</td>
<td>Orthophosphate&lt;sup&gt;2&lt;/sup&gt;</td>
</tr>
<tr>
<td>Alkalinity</td>
<td>Silica&lt;sup&gt;3&lt;/sup&gt;</td>
</tr>
<tr>
<td>Calcium</td>
<td>Temperature&lt;sup&gt;1&lt;/sup&gt;</td>
</tr>
<tr>
<td>Conductivity</td>
<td></td>
</tr>
</tbody>
</table>

1. Measured on-site.  
2. Applies when a phosphate-containing inhibitor is used.  
3. Applies when a silicate-containing inhibitor is used.
WQP Monitoring
Number of Samples

• Number of samples – two sets of samples per site and samples should be taken from taps that have been fully flushed

<table>
<thead>
<tr>
<th>System Size (No. of People Served)</th>
<th>No. of Sites (Standard)</th>
<th>No. of Samples (2 per site)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 100,000</td>
<td>25</td>
<td>50</td>
</tr>
<tr>
<td>10,001 to 100,000</td>
<td>10</td>
<td>20</td>
</tr>
<tr>

</tbody>
</table>
WQP Monitoring

- Large Systems: During the 2 consecutive 6-month monitoring periods immediately following corrosion control treatment (CCT) installation

- Medium and Small Systems: Only during monitoring periods in which either action level is exceeded

- Sample Sites
  - Entry Points: At least 1 sample every 2 weeks
    - Exception: Ground water systems may receive State approval to limit monitoring to entry point samples that are representative of water quality and treatment conditions throughout the system
  - Taps: 2 samples from each tap during monitoring period
WQP Monitoring

State Designation of OWQPs

• The State reviews WQP and lead/copper tap monitoring data collected by the system prior to and after CCT installation

• Based on this information, the State sets optimal water quality parameter (OWQP) minimums or ranges.

• OWQPs reflect optimal corrosion control conditions for the system
WQP Monitoring

After State Designates OWQPs

• Collect tap samples every 6 months (2 samples at standard number of taps)

• Collect entry point samples every 2 weeks (at each entry point or representative sites)

• Required for:
  - Systems serving > 50,000
  - Systems serving ≤ 50,000 during monitoring period(s) in which either AL is exceeded, or as required by State
WQP Monitoring

Compliance Periods

• Begins after State sets OWQPs:
  o January 1 or July 1 for systems on standard monitoring.
  o June 1 for small/medium on reduced monitoring.*

• Annual monitoring begins after 6\textsuperscript{th} consecutive 6-month period of meeting OWQPs.

• Triennial monitoring begins after 3\textsuperscript{rd} consecutive year of meeting OWQPs.

* 6-month OWQP compliance period will be June 1 – November 30.
WQP Monitoring

- OWQP compliance is based on 6-month periods.
- Systems cannot be outside OWQP ranges or below minimum for more than 9 days:
  - at a specific sampling point or combination of sampling points, or
  - for a specific WQP or combination of WQPs during a 6-month period.
- For excursions, the 9 days do not have to be consecutive.

Refer to, *How to Determine Compliance with Optimal Water Quality Parameters as Revised by the Lead and Copper Rule Minor Revisions.*

WQP Monitoring
Reduced Tap Monitoring

• Systems are eligible if they:
  – Serve > 10,000 AND
  – Maintain OWQPs for 2 consecutive 6-month periods
• Tap sampling is reduced per table below
• Entry point sampling remains the same (every 2 weeks)

<table>
<thead>
<tr>
<th>System Size</th>
<th>Standard</th>
<th>Reduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt; 100K</td>
<td>25</td>
<td>10</td>
</tr>
<tr>
<td>10,001 – 100K</td>
<td>10</td>
<td>7</td>
</tr>
<tr>
<td>3,301 – 10K</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>501 – 3,300</td>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>101 – 500</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
WQP Monitoring

Reduced Monitoring

• Annually
  – OWQP maintained for 3 consecutive years
    • Continue with entry point sampling (every 2 weeks)
    • Reduce tap sample frequency to annually

• Triennial
  – Annual OWQP maintained for 3 consecutive years;
  or
  Any PWS with 90th percentile levels ≤0.005mg/L for Pb and ≤0.65mg/L for Cu and maintains OWQP for 2 consecutive 6-month monitoring periods
    • Continue with entry point monitoring (every 2 weeks)
    • Reduce tap sample frequency to once every three years

Annual samples should be spread evenly throughout the year to capture seasonal variability.
WQP Monitoring
Return to Standard Monitoring from Reduced Monitoring

• If system fails to meet OWQPs for more than 9 days in a 6-month compliance period:
  – Return to 6-month monitoring frequency
  – Systems serving > 10,000 must collect standard number of WQP taps

• Can re-qualify for reduced monitoring
Notification of Treatment Changes and Source Additions
Long-Term Treatment Changes and New Source Additions

Systems Affected

- Systems on reduced lead and copper tap monitoring

Rule Requirement

- Requires prior notification and approval of treatment change or source addition
- Limits notification of treatment changes to “long-term changes”
- Notification due as specified by State, or early as possible prior to change or addition
Long-Term Treatment Changes and New Source Additions

- Examples of long-term treatment changes:
  - Switching secondary disinfectants
  - Switching coagulants
  - Switching corrosion inhibitor products
  - Changing dosage of existing chemicals
  - Installation of membrane filters, ozonation, enhanced coagulation/softening

- Does NOT include chemical dose fluctuations associated with daily raw water quality changes
Long-Term Treatment Changes and New Source Additions
LCR Requirements for OCCT (2015 memo)

- Clarifies LCR requirements for large systems
- Before, during and after any proposed changes, systems must continuously:
  - Operating and maintaining CCT
  - Meet State-designated OWQPs
- Recommends systems not subject to a notification requirement also notify States prior to implementing changes/additions to ensure optimal corrosion control and continued public health protection
Long-Term Treatment Changes and New Source Additions

• Examples of source water additions include:
  ✓ Switching source types
  ✓ Adding treated surface water to ground water only system
  ✓ Adding new well from different aquifer

• Seasonal or interannual source changes DO NOT require notification if:
  ✓ Covered by previous OCCT studies and sampling, and
  ✓ Covered within OCCT designation framework

Lead and Copper Rule 3-Part Webinar Series

- **Part 1:** Requirements Before an Action Level Exceedance
  May 11th 2016, 1pm- 2:30pm EST  COMPLETED
  May 18th 2016, 2:30pm- 4pm EST  COMPLETED

- **Part 2:** Requirements After an Action Level Exceedance
  June 15th 2016, 1pm-2:30pm EST
  June 29th 2016, 1pm-2:30pm EST

- **Part 3:** Compliance Determination and Reporting Requirements
  August 17th 2016, 2:30pm-4pm EST
