Description:
A protected area of trees, woody shrubs, grasses, and other vegetation located adjacent to or up-gradient from water courses, wetlands, and impounded water bodies.

**AWQA Minimum Requirements:**
Apply this BMP in areas where a portion of the runoff occurs as shallow groundwater flow and where water quality is impaired or there is a high potential for water quality impairment. The riparian buffer area should be adjacent to permanent or intermittent streams, lakes or ponds, and wetlands. Livestock activities are acceptable in these areas. Fencing of riparian buffer zones will not be required; however, the selection and management of vegetation must be sufficient to adequately control or significantly abate potential soil erosion and provide adequate filtering and uptake benefits from the affected areas. If vegetation is not capable of withstanding grazing pressure, then livestock should be excluded except at designated crossing areas and watering sites (*Livestock BMP#4*). Temporary fence may be used to exclude livestock from zones that may be grazed temporarily while maintaining the effectiveness of the practice.

**Recommendations:**
Consider the type and quantity of potential pollutants that will be derived from the drainage area. Consider the adverse impacts which could result from uncontrolled and concentrated flows through the buffer zones if sheet flow is not maintained. Consider the sequence of conservation practice application to assure that excessive erosion and pollution rates do not prohibit the successful establishment of the buffer zones. The width of the riparian area may be adjusted to accommodate exceptional situations such as unique landforms, sensitive areas, public structures, etc. **Consider establishing “zones” in the riparian area that may include trees (Zone 1), small trees/shrubs (Zone 2), and native warm season grasses and forbs (Zone 3).** Consider removing invasive species (i.e. bush honeysuckle) using methods/equipment that does not contribute to erosion.
